

Abundance Constraints

on Sources of Nucleosynthesis, and on
the Chemical Evolution of the Universe and its Components

- Characteristic Cosmic Gamma-Rays -

NIC School 2008

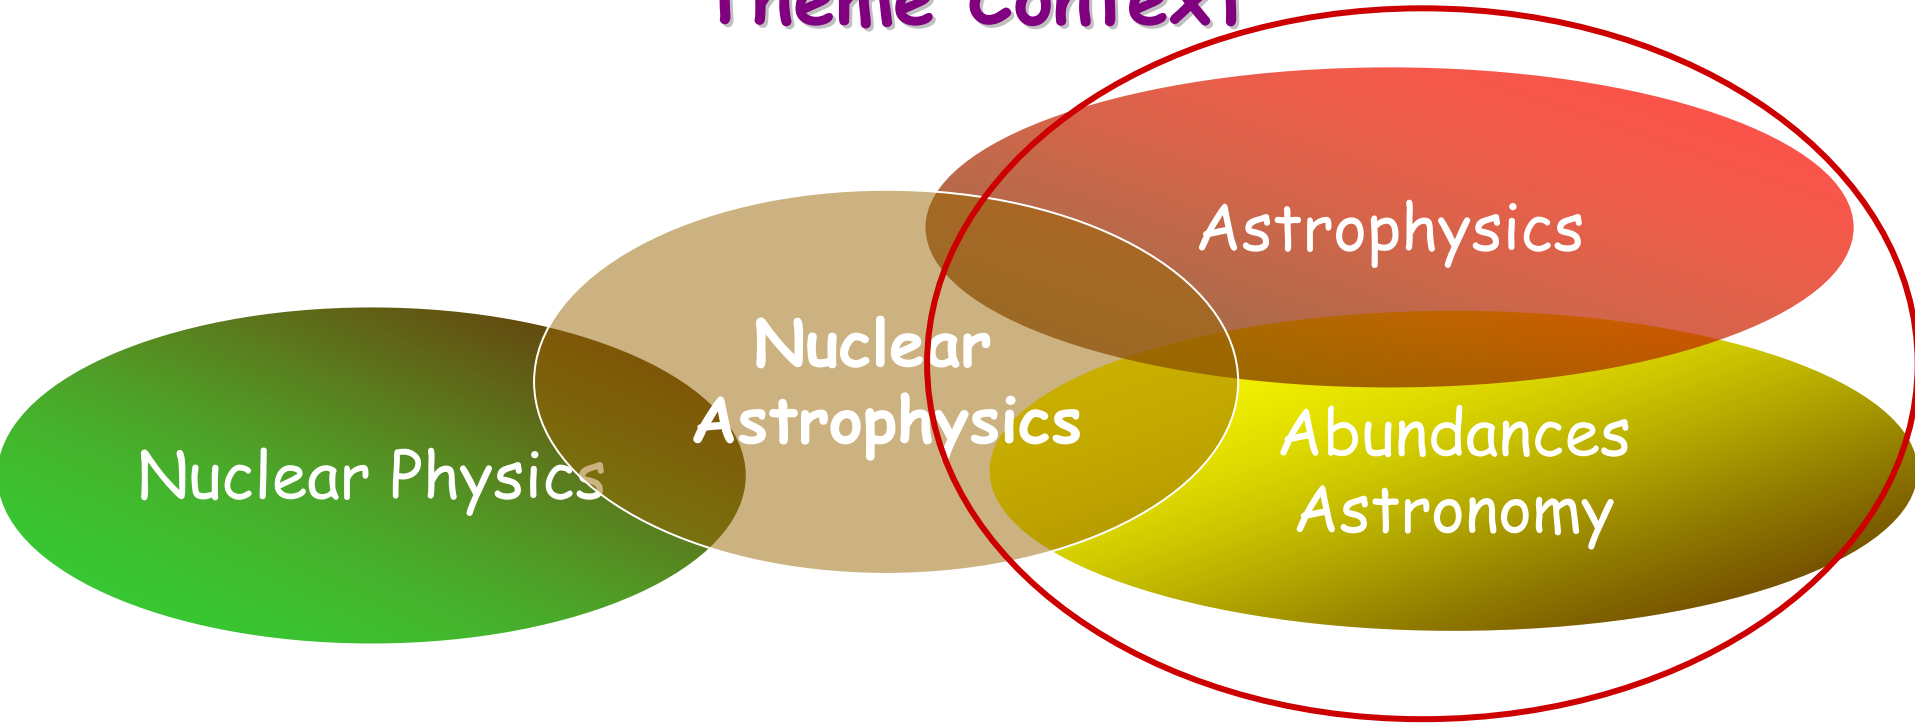

24 Jul 2008

by Roland Diehl

Outline

- ☆ Themes of my lectures, the context, the role of abundances
- ☆ How cosmic gamma-rays set "abundance constraints"
- ☆ What we learned from gamma-ray constraints
- ☆ How else do we obtain "abundance constraints"
- ☆ What we learned from "abundance constraints"

Theme Context

Observing Nuclear Reactions in Cosmic Environments

Observations of Nuclear Ashes:
Radioactive Isotopes,
Absorption Lines,
Presolar Grains, ...:
Abundances,
Kinematics, ...

H-Burning
He-Burning
C/O-Burning
Si-Burning
NSE, QSE
 α -Process
r-Process
s-Process
p/ γ -Process

Stellar Interiors
(Core, Shells)
WD/NS Accretion
Novae
Supernovae
(thermonuclear, core collapse)
ISM / Cosmic Rays

The General Context:

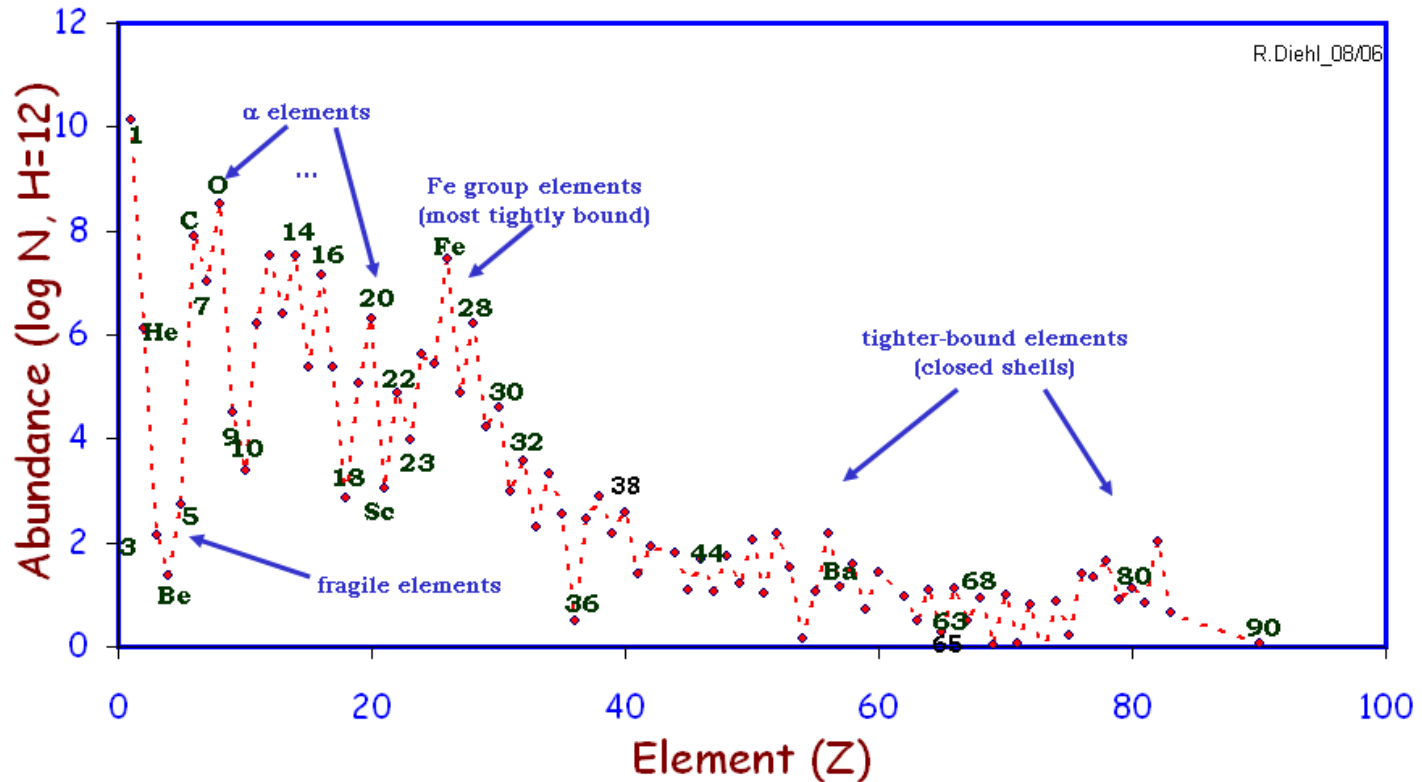

How Do Nucleosynthetic Sources Enrich the Universe with Heavy Elements?

☆ Nuclear Reactions in Stars and Supernovae Rearrange Baryons -> New Atoms

☆ New Atoms are Mixed into ISM which Forms New Stars & Planets

Abundances: An Astronomical Measurement

★ Relevance of Knowledge about Cosmic Abundances:

☞ Constraints for Nucleosynthesis

- Nuclear Reactions in Cosmic Environments
- Astrophysical Conditions in Nuclear-Burning Sites

☞ Constraints for Evolutionary Processes in the Universe

- Formation of Stars and Stellar Assemblies...Galaxies
- Enrichment of Cosmic Gas Supplies with Nucleosynthesis Products

One of the Key Tools of Astrophysics: Where do specific atomic nuclei and their abundance originate?

☆ ... the current 'lithurgy'
→ how much do we understand?

Courtesy: Andy Davis

Diversity of Complementing Observing Methods

...more next Lecture...

Nucleosynthesis Products: Where We See It

☆ We Would Like to Know Compositions in...

- ☞ Intergalactic Medium, Galaxies
- ☞ Interstellar Medium
- ☞ Supernovae, Novae, and their Remnants
- ☞ Planetary Nebulae

(for the study of...)
cosmic evolution
galaxy evolution, mixing
specific sources
specific sources

☆ We Can Measure Compositions in

☞ Material Samples

- » Meteorites, Planets, Comets...
- » Cosmic Rays ('CRs'), Solar Energetic Particles ('SEPs')
- » Meteoritic Inclusions: Presolar Grains

☞ Stellar Photospheres

- » Stars with Original/Natal Composition in Photosphere
- » Stars with Internal Mixing

☞ Gas Clouds

- » Absorbing ISM in front of Stars
- » Absorbing IGM in front of Quasars & Galaxies

Abundance Observation Sites (1 of 4)

- Earth Crust

- ☆ Planet Formation from Condensed Matter

- ☞ Corrections for

- » Planet Formation Physics
 - » Gravitational Differentiation
 - » Chemical Differentiation
 - » Radioactive Decays

- Meteorites

- ☆ Rocks

- ☞ Diversity

- » Meteorites with/without Glass-Like Inclusions (Chondrites/Achondrites)
 - » Stony Iron Meteorites
 - » Iron-Like Meteorites

- ☞ Corrections for

- » Rock Formation
 - » Radioactive Decays
 - » Cosmic-Ray Bombardement
 - » Outgassing
 - » Chemical Differentiation
 - » Presolar Inclusions

Abundance Observation Sites (2 of 4)

- Solar Energetic Particles

- ☆ Particles Accelerated from Solar Activity

- ☞ Corrections for

- » Acceleration Process (First-Ionization Potential Selection)
 - » Acceleration Region Sampling Bias

- Cosmic Rays

- ☆ Particles Accelerated from ??? (ISM Shock Regions?)

- ☞ Corrections for

- » Acceleration Process (First-Ionization Potential Selection)
 - » Acceleration Region Sampling Bias
 - » Propagation Effects (Spallation Secondaries & Losses)

- Interstellar Medium

- ☆ Particles Mixed from Turbulence, with Source Injections

- ☞ Corrections for

- » Propagation Effects (Gravitational Selections, Magnetic-Field Selections)
 - » Condensations on Dust Grains

Abundance Observation Sites (3 of 4)

Stellar Photospheres (general)

☆ Gas Globe, Stabilized from Gravity & Nuclear Burning in Interior

☞ Diversity

- » Evolved Stars (Giant Phases, i.e. after "Dredge-Ups"; C-Stars; WR Stars)
- » Variability (AGB Stars, RCrB Stars)
- » Binaries (BaII Stars, Be Stars)

☞ Corrections for

- » Atmospheric Structure Details
- » Radioactive Decays
- » Chemical History of Birth Place in Galaxy
- » Extrastellar Contributions (anomalous Cosmic Rays, Dust)

Solar Photosphere

☆ Solar System Formation 4.6 Gy ago

☞ Corrections for

- » Solar-System Birth Place in Galaxy
- » Extrasolar Contributions (anomalous Cosmic Rays, Dust)

Abundance Observation Sites (4 of 4)

Gas as Radiation Absorber

☆ Gas Assembly, Illuminated from Back Side

☞ Diversity

- » Interstellar Gas Against Background Stars
- » Interstellar and Intergalactic Gas Across Range of Redshifts
- » Circumstellar Gas Around a Source

☞ Corrections for

- » Background-Source Spectral Energy Distribution
- » Foreground or Background Absorbers
- » Selection Effects due to Background Source Type

Hot, Recombining Gas

☆ Hot States of Interstellar/Intergalactic Gas

☞ Diversity

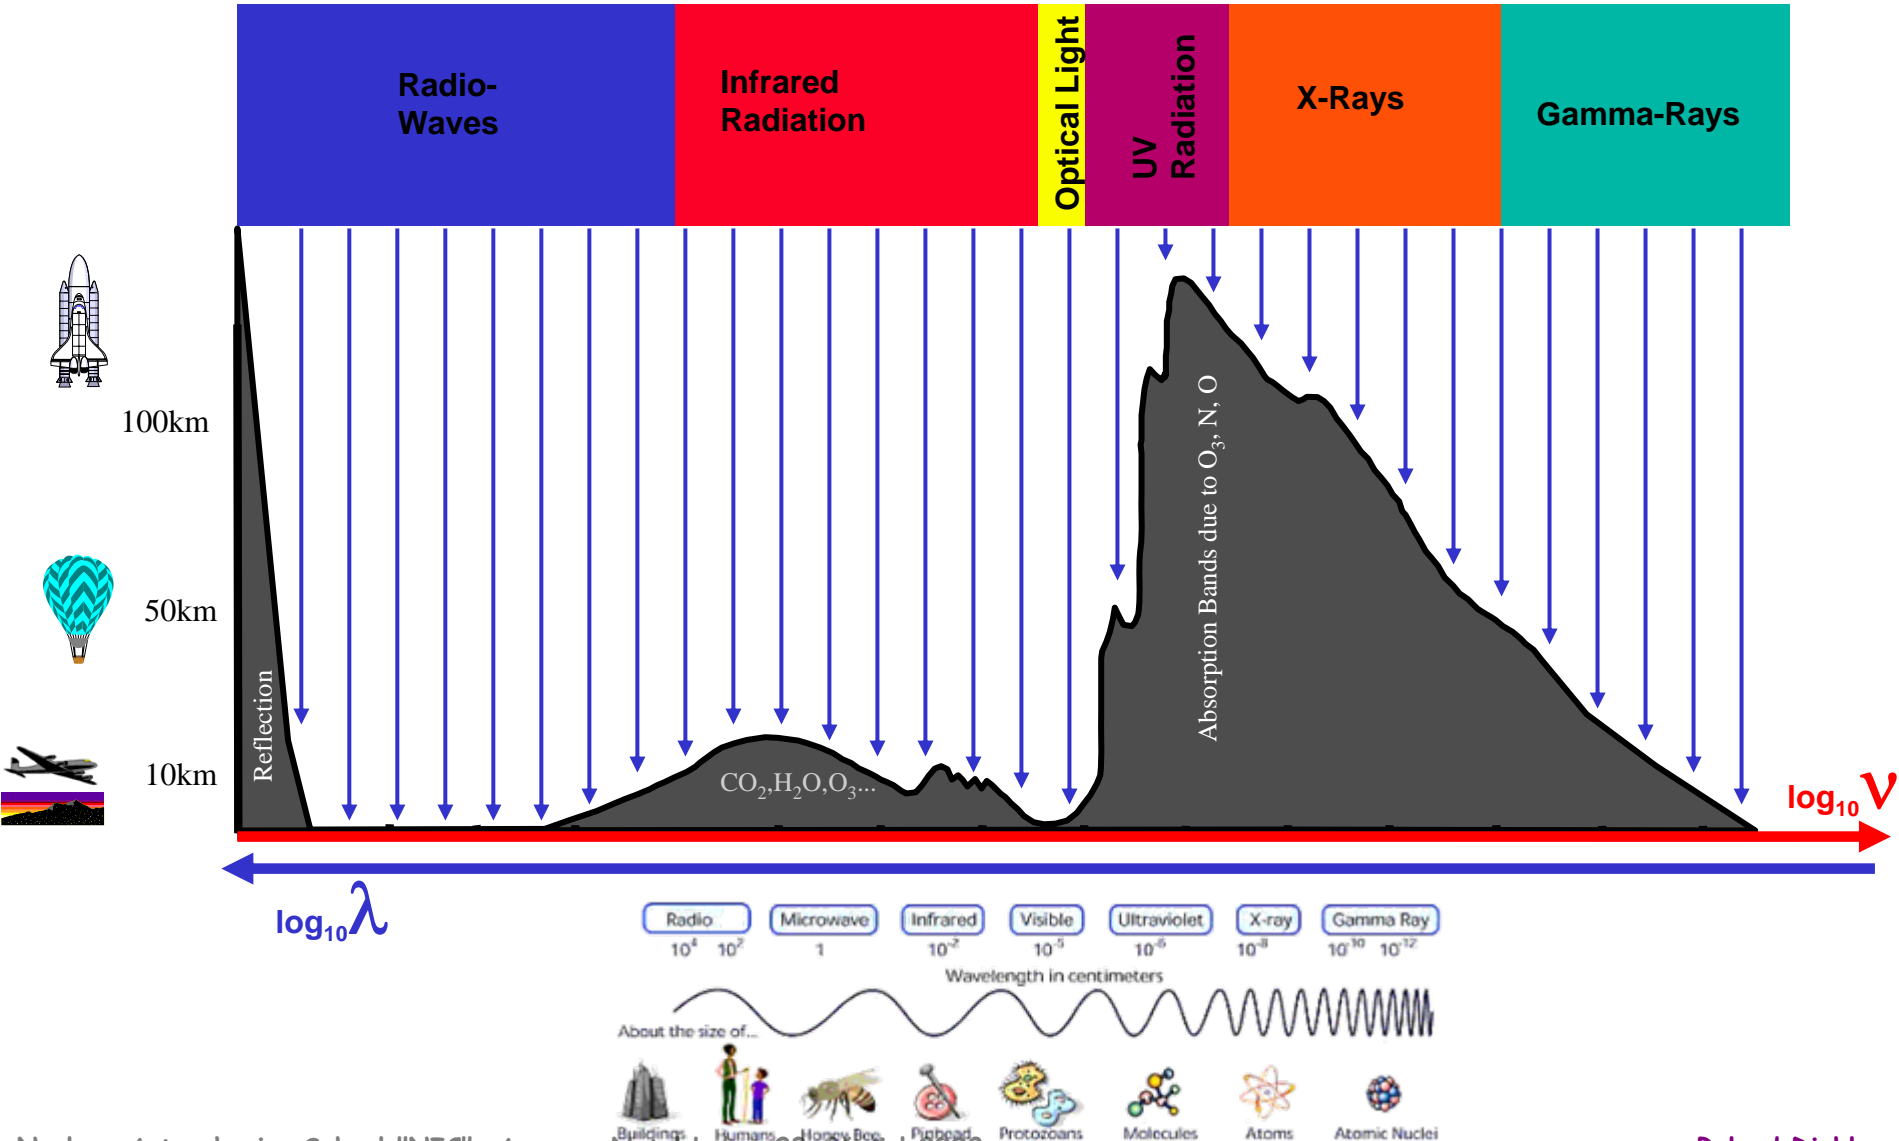

- » Interstellar Gas around an Energetic Source (HII Regions, PWNe, SNR)
- » Interstellar and Intergalactic Gas Heated by Diversity of Sources (SB's, Starburst Gal., ICM)

☞ Corrections for

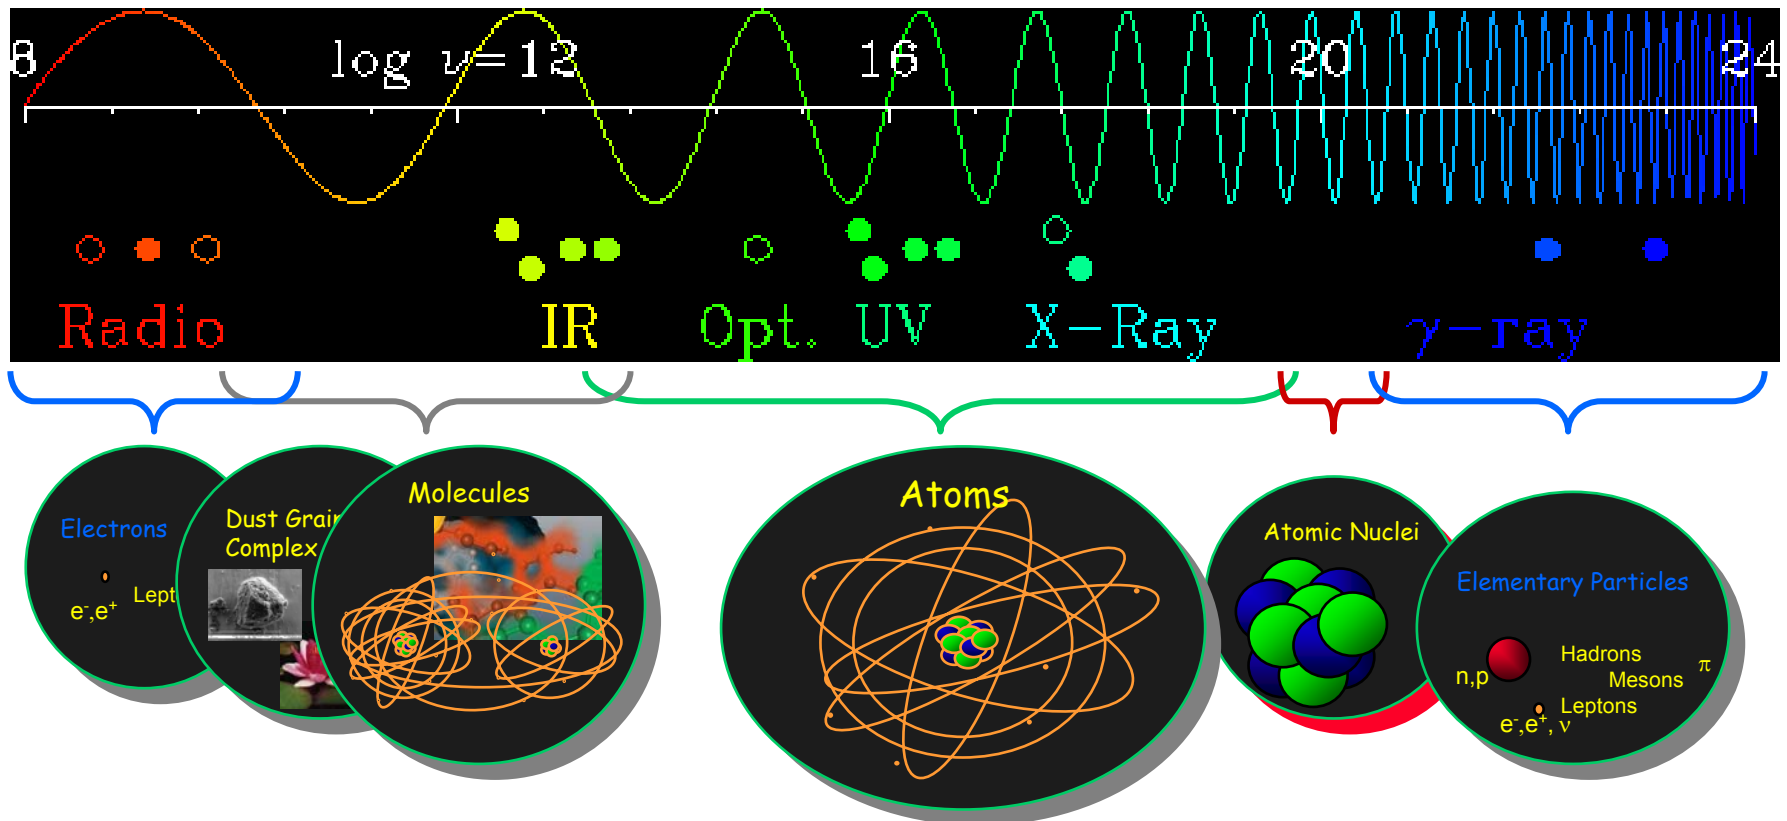

- » Central-Energy Source Properties (time variations, energy flow variations)
- » Non-Equilibrium States of Recombining Gas

Astronomical Observations throughout the e.m. Spectrum

Spectroscopic Studies of Cosmic Elements

★ Mostly: Atomic-Shell Absorption-Line Spectra

☞ \rightarrow Galactic Archeology; Metallicity Gradients; Cosmic Chemical Evolution

★ Specific Enhancements:

☞ Atomic Emission & Recombination-Line Spectroscopy \rightarrow Gas in Special Sites

☞ Molecular Lines \rightarrow Cold Gas/Clouds

☞ and: Nuclear Lines, Annihilation Lines, Cyclotron Lines, ... \rightarrow ...

☆ Cosmic Nucleosynthesis Produces New Isotopes

👉 Diagnostics of Nuclear Fusion Reactions

→ Thermodynamic Variables in Hot (GK) Sites

The Isotopic Landscape and Cosmic Sources

- ~300 Stable and ~2400 Radioactive Isotopes
- Cosmic Nucleosynthesis Covers Much of this Range
- Knowledge of Nuclear Physics is Incomplete

Nucleosynthesis Study with Gamma-Rays

-> Physics / Processes at/inside the Nucleosynthesis Site

Isotope	Mean Lifetime	Decay Chain	γ -Ray Energy (keV)
^7Be	77 d	$^7\text{Be} \rightarrow ^7\text{Li}^*$	478
^{56}Ni	111 d	$^{56}\text{Ni} \rightarrow ^{56}\text{Co}^* \rightarrow ^{56}\text{Fe}^* + e^+$	158, 812; 847, 1238
^{57}Ni	390 d	$^{57}\text{Co} \rightarrow ^{57}\text{Fe}^*$	122
^{22}Na	3.8 y	$^{22}\text{Na} \rightarrow ^{22}\text{Ne}^* + e^+$	1275
^{44}Ti	89 y	$^{44}\text{Ti} \rightarrow ^{44}\text{Sc}^* \rightarrow ^{44}\text{Ca}^* + e^+$	78, 68; 1157
^{26}Al	$1.04 \cdot 10^6\text{y}$	$^{26}\text{Al} \rightarrow ^{26}\text{Mg}^* + e^+$	1809
^{60}Fe	$2.0 \cdot 10^6\text{y}$	$^{60}\text{Fe} \rightarrow ^{60}\text{Co}^* \rightarrow ^{60}\text{Ni}^*$	59, 1173, 1332
e^+	$\dots \cdot 10^5\text{y}$	$e^+ + e^- \rightarrow \text{Ps} \rightarrow \gamma\gamma..$	511, 511

- 511 keV, ^7Be -> Novae
-> p-Captures, β^+ Decays
-> ^{19}F Production...

^{26}Al -> Reaction Path Details in Stars/SNe, ν -Process
-> Metal/Fe Ratio, Si/Fe

^{44}Ti , ^{56}Ni -> Most Stable Isotopes
 $^{56}\text{Ni}/^4\text{He}$, Freeze-Out of NSE
-> Metal/Fe Ratio, Heavies/Fe

Gamma-Rays for Cosmic-Isotope Measurements

Special Characteristics:

The diagram illustrates the decay of an Aluminum (Al) nucleus into a Magnesium (Mg) nucleus. It shows three stages of the nucleus: Al at the top, Mg* in the middle, and Mg at the bottom. A red arrow points from Al to Mg*, with the text "Proton → Neutron" indicating the transformation. A second red arrow points from Mg* to Mg. A yellow wavy line labeled with the Greek letter gamma (γ) represents the emission of a gamma ray from the Mg* nucleus. In the background, a satellite with solar panels is shown, and a horizontal band of green and red colors represents a gamma-ray emission profile across a galaxy.

- ☆ Emission due to Radioactivity
 - ☞ No "Activation" (thermal, ionization)
- ☆ Isotopic Information
 - ☞ Related to Specific Nuclear Reactions
- ☆ Penetrating Radiation
 - ☞ No Occultation Corrections
- ☆ Penetrating Radiation
 - ☞ Poor Imaging Resolution (deg...arcmin)
- ☆ Low Signal, High Background
 - ☞ Galactic Sources, SN Ia < 10Mpc

Gamma-Ray Astronomical Telescopes: Interaction of HE photons with matter

Photon interaction with matter (Pb)

Secondary photons / electrons
-> multi-element & tracking
detector assemblies

-> Secondary Particles ... -> e.m. cascade

MeV Range Gamma-Ray Telescope Principles

- **Simple Detector (& Collimator)**
(e.g. HEAO-C, SMM, CGRO-OSSE)
Spatial Resolution (=Aperture) Defined Through Shield

- **Coded Mask & Detector Array**
(e.g. SIGMA, INTEGRAL, SWIFT)
Spatial Resolution Defined by Mask & Detector Elements Sizes

- **Compton Telescopes**
(Coincidence-Setup of
Position-Sensitive Detectors)
(e.g. CGO-COMPTEL, MEGA, ACT,...)
Spatial Resolution Defined by Detectors' Spatial Resolution

Achievable Sensitivity: $\sim 10^{-5}$ ph cm⁻² s⁻¹, Angular Resolution \geq deg

"Supermirrors": Extending X-Ray Optics to γ -Rays

☆ "NUSTAR"

Mission Concept

- ☞ Two-Spacecraft Formation
- ☞ Optics with
 - 130 Nested Shells of Grazing-Incidence Mirrors:
W/SiC and Pt/SiC
 - Surface Reflectivity up to W K-Edge @69 keV
+ Grazing Incidence
→ Use Up To 80 KeV
- ☞ 10 m Focal Length
- ☞ 40 arcsec Spatial Resol.
- ☞ PI: F. Harrison / CalTech

☆ Status:

- ☞ Phase A Study 2003-05,
Selection 2005 for Launch in
2009
- ☞ On Hold Since 2006

Optics bench

Energy range	6–80 keV
Angular resolution (HPD)	40''
FOV	8.4 × 8.4'
Source positions	5''
Spectral resolution	900 eV 68 keV
Timing resolution	0.1 ms
Line sensitivity (10 ⁶ s, 68 keV)	10 ⁻⁷ ph/cm ² /s
Continuum sensitivity (10 ⁶ s, 3 σ , $\Delta E/E$) = 0.5	0.7 μ Crab (20 keV) 6 μ Crab (60 keV)
Background in HPD/module (40 keV)	1.1 × 10 ⁻⁵ cts/s/keV
Effective area (20 keV)	500 cm ²
ToO response	<24 h

INTEGRAL: Ge γ -Spectrometry in Space!

17 October 2002:
06:41 Launch from Baikonur / Kasachstan

Summer 2008:
Healthy Spacecraft & Instruments
Mission Operations till 2012+
SPI: Coded-Mask Telescope 15-8000 keV
Energy Resolution ~ 2.2 keV @ 662 keV
Spatial Precision 2.6° / ~ 2 arcmin
Field-of-View $16 \times 16^\circ$

Future Mission Options: 0.1...100 MeV

Large Area Coded Aperture--(EXIST...)

Laue Gamma-Ray Collector (Max)

Advanced Compton Telescopes (MEGA, ACT)

Gamma Ray Fresnel Lens (Multiple Spacecraft)

Astronomy in the Range of Nuclear Lines

- Sources of Cosmic Gamma Ray Line Radiation:
 - ☆ Typical Intensities $\sim 10^{-3} \dots 10^{-6} \text{ ph cm}^{-2} \text{ s}^{-1}$
 - ☆ Embedded / Occulted Sources
 - ☆ Examples:
 - ☞ Interstellar-Medium Interactions
 - ☞ Cosmic Radioactivities
- Instrumental Constraints:
 - ☆ Low Interaction Cross Sections
 - ☆ No/Problematic Reflecting Surfaces
 - ☆ Instrumental Background from Cosmic-Ray Activation

Future Goals for γ -Ray Line Astronomy

Capabilities for Nuclear Astronomy

☆ Experimental Technology 'Watersheds'

☞ near ~100 keV: Fading Mirror Performance

☞ below ~100 MeV: Fading Tracking Detector Efficiency

☞ the Nuclear Energy Range is Difficult

- CR → Radioactivities

What Did We Achieve?

★ Comments on Science Results, and How They Have Been Obtained

A Supernova

How Does a SNIa Explode?

- C Ignition at M_{Ch} Limit (possibly many ignition points)
- Turbulent Flame Propagation
- WD Expansion \rightarrow Flame Extinction
- Issues: Rapid Time Scales!
 - » Nuclear Burning $C+O \rightarrow ^{56}Ni...$
 - » Expansion
 - » Mixing

👉 Measure Amount and Velocity Distribution of ^{56}Ni Directly in γ -Rays!

Gamma-Rays from Supernovae Ia

- Rarely SNIa ^{56}Ni Decay Gamma-Rays are Above Instrumental Limits ($\sim 10^{-5} \text{ ph cm}^{-2} \text{ s}^{-1}$)

- ~ 2 Events / 9 Years CGRO
- ~ 2 Events / 2 Years INTEGRAL Mission

• COMPTTEL

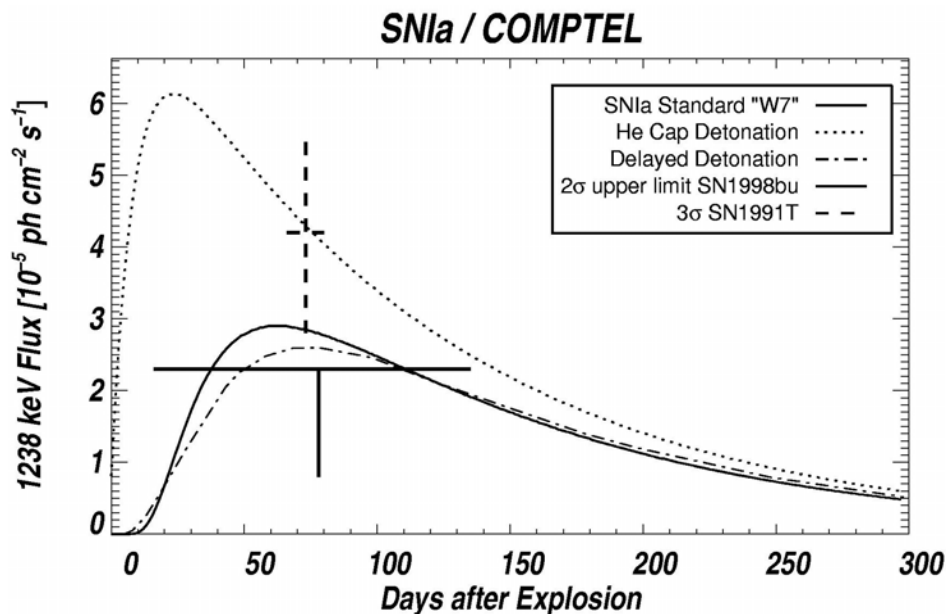

☞ Signal from SN1991T
(3σ) (13 Mpc) \rightarrow 1.65 M_{\odot} of ^{56}Ni !

☞ Upper Limit for SN1998bu (11 Mpc)

★ The ^{56}Ni Power Source:
0.5 M_{\odot} of ^{56}Ni ??

★ Which Model Flavor?

☞ W7 / HeD / DDT / DD / ...

Still No Luck with SNIa Events

SNIa (1990–2005) Galactic coordinates

☆ Spectroscopy Can Discriminate Between Models only for Nearby (hence rare) SNe (<5 Mpc)

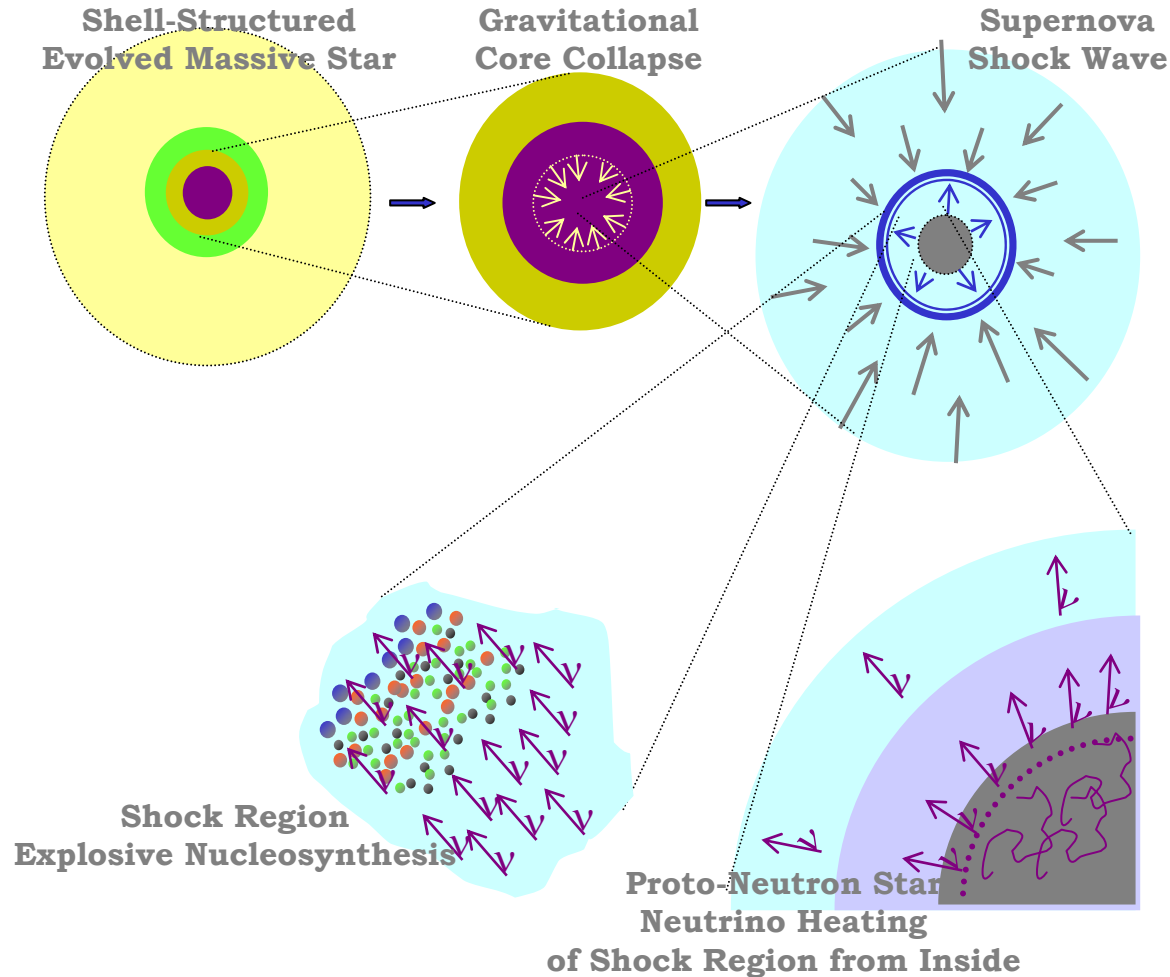

Supernova Remnants: Evolutionary States

Gamma-Rays Can Extend Presently-Favourable X/R/O Regime:

- ☆ Search for New SNR
- ☆ Diagnostics from Line Shape & Light Curve

Core Collapse-Supernovae: Model

- **Explosion Mechanism = Competition Between Infall and Neutrino Heating**
- **3D-Effects Important for Energy Budget AND Nucleosynthesis**

Nuclear-Physics Issues in CC-Supernova Models

$^{45}\text{Sc}(p,\gamma)^{46}\text{Ti}$

- 3D-Effects Important for Energy Budget AND Nucleosynthesis
- Location of Ejecta/Remnant Separation?
- ^{44}Ti Produced at $r < 10^3$ km from QSE/Si-Burning & α -rich Freeze-Out,
 \Rightarrow ^{44}Ti Gamma-Rays are Unique Probe (+Ni Isotopes)

SN1987A

FIGURE 1. *Chandra* ACIS (in the 0.3–8 keV band) false-color images of SNR 1987A. In each panel, the observation date and age (days since the SN, in parentheses) are presented.

☆ The late SN light originates in energy input from ^{44}Ti decay

- ☞ Estimate from light-curve modelling (*Fransson & Kozma 1993; 2002*)
 - $(1.5 \pm 1.0) 10^{-4} M_{\odot}$ of ^{44}Ti
- ☞ Estimate from late optical emission (*d2875*) (*Chugai et al. 1997*)
 - $(1-2) 10^{-4} M_{\odot}$ of ^{44}Ti
- ☞ Upper limit from FeII lines in IR (= main emission in late phase) (*25.99 μm , d3999, d3425, Lundquist et al. 1999, 2001*)
 - $< 1.1 10^{-4} M_{\odot}$ of ^{44}Ti

☞ Direct ^{44}Ti Gamma-Ray Measurements not Feasible with Current Instruments

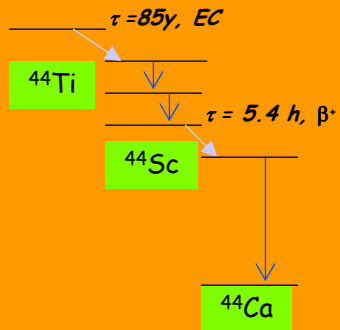

Fig. 1. Evolution of temperature for the iron-rich region in SN1987A, together with the fluxes of the strongest Fe II lines. The IR-catastrophe is seen to set in at ~ 600 days.

^{44}Ti γ -rays from Cas A

$\tau=85\text{y}$ (Ahmad et al. 2006)

89 y | $^{44}\text{Ti} \rightarrow ^{44}\text{Sc}^* \rightarrow ^{44}\text{Ca}^* + e^+$ | 78, 68; 1157

^{44}Ti Ejected Mass

$\sim 0.8-2.5 \cdot 10^{-4} M_{\odot}$

Cas A: A Well-Studied Young Nearby SNR

Fig. 2. An example of a spectral fit within a single $20'' \times 20''$ pixel – cool component in blue, hot component in green and full model in red. XMM-Newton

Fig. 3. Contrast maps of the $10\ \mu\text{m}$ emission (left column) and of the $9.6\ \mu\text{m}$ silicate dust emission (right column) overlaid onto an optical image of the Cassiopeia A supernova remnant. At each contrast level the flux is divided by a factor 1.5. Instrumental ghost effects were taken into account to limit the lower contrast of dust. The same line and diffuse emission are displayed from spectra such as those on the right of the image (not here). The spectra have been obtained with ISO-CAM at a spatial resolution of $0'' \times 0''$; the ISO-CAM grid corresponding to the spectrum is represented on the image by green squares. The optical image has been obtained with the SIS instrument at CFHT.

- ~330 year-old SNR at ~3.4 kpc
- Massive Progenitor (10-25 M_{\odot})
- Filaments, Fast Ejecta (knots), Fe-rich Clumps, No Onion-Shell-Like Elemental Morphology, Jet: Asymmetric Explosion
- ^{44}Ti (and ^{56}Ni) Ejection
- Unseen SN \rightarrow CSM Dust
- Central Object (NS/BH?)

\Rightarrow (?)

- Core Collapse SN with Unusual Asymmetries?
- ^{44}Ti Emission Affected by Ionization?

SPI and ^{44}Ti from Cas A

- Joint analysis of all lines with SPI (INTEGRAL's spectrometer)
- Total significance ~ 3 sigma
- Flux consistent with IBIS $(2.1 \pm 0.7) \times 10^{-5}$ ph cm $^{-2}$ s $^{-1}$
- Additional line broadening: 430 ± 240 km/s
- Bulk velocity: 500 ± 200 km/s (redshifted, like Fe-K?)
- i.e. ^{44}Ti is within reverse shock (i.e. cold/freely expanding)

Jacco Vink Integral observations of Cas A: ^{44}Ti properties & hard X-ray continuum
Schloß Ringberg, January 8, 2008

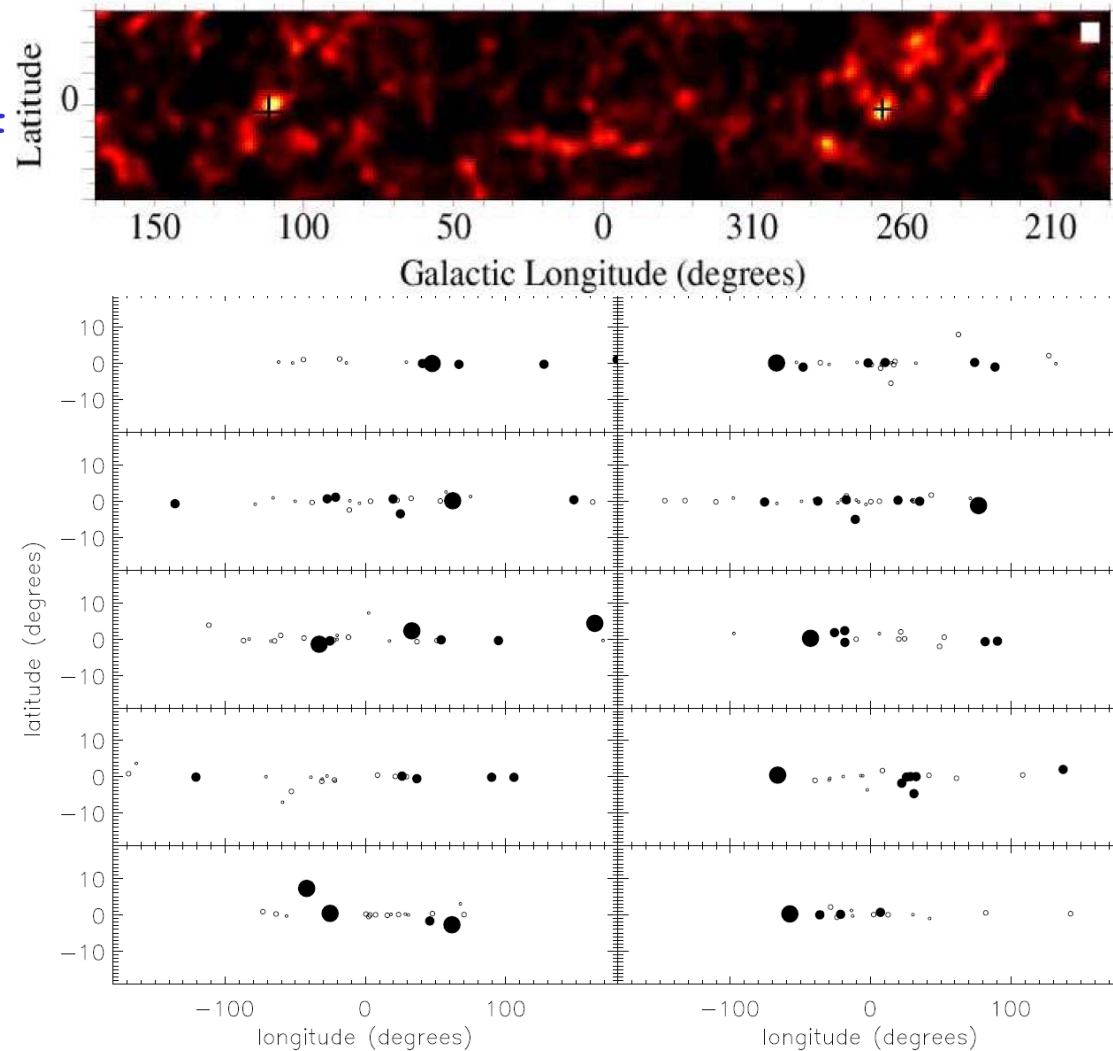

14

SNR Kinematics with γ -Ray Lines

☞ Internal Consistency Checks on Intensity, Systematics

The Sky in ^{44}Ti Gamma-Rays

The et al. 2006

● : $f_\gamma > 10^{-4} \text{ cm}^{-2} \text{ s}^{-1}$
 ◐ : $10^{-5} \text{ cm}^{-2} \text{ s}^{-1} < f_\gamma < 10^{-4} \text{ cm}^{-2} \text{ s}^{-1}$
 ○ : $10^{-6} \text{ cm}^{-2} \text{ s}^{-1} < f_\gamma < 10^{-5} \text{ cm}^{-2} \text{ s}^{-1}$
 ◦ : $10^{-7} \text{ cm}^{-2} \text{ s}^{-1} < f_\gamma < 10^{-6} \text{ cm}^{-2} \text{ s}^{-1}$

We do NOT see the Number of Expected Young SNRs

☆ Assumptions

- ☞ Galactic SNR Spatial Distribution from Massive Stars
- ☞ cc-SN Frequency 1/30y
- ☞ SN Yields in ^{44}Ti Must Explain Standard Abundance of ^{44}Ca (= 3* Model Yields)

☆ Expectations

- ☞ More than a few Sources
- ☞ $P(0)=0.0017, P(1)=0.012$

^{44}Ti is NOT from Common cc-SNe

- ☞ 3D Effects?
- ☞ Exceptional SNIa?

"Normal" Core Collapse Supernovae (?)

Consistency Check: Cas A vs. what we know about ^{44}Ti ...

- ☆ ^{44}Ti from SAD/Models/SN1987A/ γ -Rays, vs. ^{56}Ni
- ☆ Only Non-Spherical Models $\star \star$
Reproduce Observed Ratios \star
- ☆ Sky Regions with Most Massive Stars are ^{44}Ti Source-Free (COMPTEL, INTEGRAL)

Non-spherical explosions?? (->GRB)

Need Event Statistics, ^{44}Ti Spectra

Novae

- Classical Novae:
 - ☆ Accreting WD in Binary System
 - ☆ Runaway H Burning with Nuclear Processing of Upper WD Layer (p process)
 - ☆ Ejection of $\sim 10^{-4} M_{\odot}$
- Issues:
 - 👉 Burning Time Profile
 - 👉 Fuel Composition and Mixing
 - 👉 Ejected Mass
 - 👉 Nuclear Reactions

Nova Diagnostics with Nuclear Lines

- ★ Brief Annihilation Flash
- ★ β Decay Continuum (before optical nova!)
- ★ ^{22}Na Radioactivity (O-Ne Novae)

Nova Gamma-Ray Light Curves

☆ Need Sky Survey

☞ Optical Nova (=discovery) After Characteristic Gamma-Ray Signals

- *Hernanz et al., 1997-2003*

Still No Nova Lines Detected

- Expectations for $I_{22\text{Na}} \sim$ Factor 10 Below Instrumental Sensitivities

^{22}Na Line:
SXI Galactic Bulge Skymap

Jean et al. 2005
Testing for a Nova Galaxy Model

Partial Summary: Methods of Cosmic Gamma-Ray Measurements

- Gamma-Ray Telescopes are Complex Instruments
 - ★ Focusing Optics is Hardly Obtainable
 - ★ Casting a Shadow is a Working Compromise
 - ★ Multi-Detector Coincidence Instruments are Most Promising
 - ★ Backgrounds from Internal Radioactivity are High
 - ★ Analysis Techniques are Based on Constrained Deconvolutions
- Future Experiments/Mission Opportunities are Rare
 - ★ ESA's Cosmic Vision Program for a 'Gamma-Ray Imager'?
 - ★ National Programmes for Small Missions (Max, Simbol-X,...)?
 - ★ A Future US Perspective for ACT?
- The Brightest Sources Have Been Seen
 - ★ ^{26}Al Line Science is an "Astronomy"
 - ★ ^{60}Fe and e^+ Annihilation Adds Specific Aspects
 - ★ ^{44}Ti is a Key Diagnostic for SN Interiors

Gamma-Ray Lines Constraints on Cosmic Nuclei: Summary (I)

- Live Cosmic Nucleosynthesis Detected. **More?**
 - ISM: $e^+ {}^{26}\text{Al}$ ${}^{60}\text{Fe}$; SNae: ${}^{56}\text{Ni}$, ${}^{57}\text{Ni}$, ${}^{44}\text{Ti}$ ${}^{22}\text{Na}$?
- Cosmic Nucleosynthesis Environments Being Studied

★ ${}^{44}\text{Ti}$

★ ${}^{56}\text{Ni}$

★ ${}^{26}\text{Al}$

and e^+ Annihilation

Thank you!
