

# Cascade Transitions in $^{16}\text{O}$ and the $^{12}\text{C}(\alpha, \gamma)^{16}\text{O}$ Reaction Cross Section

CATALIN MATEI

Oak Ridge Associated Universities / Oak Ridge National Laboratory

# helium burning reactions

The relative rates of these two reactions determine the  $^{12}\text{C}/^{16}\text{O}$  ratio at the end of He burning and beyond.

# ground state transitions

**E1 E2**

C.R. Brune PRL 83 (1999)

# ground state transitions

C.R. Brune PRL 83 (1999)

E1 ground state cross section:

- resonant capture through  $1^-$  states
- $\sigma$  at 300 keV dominated by the high-energy tail of 7.12-MeV state
- $\alpha$ -reduced width constrained
- $S_{E1}(300)=79\pm 21$  keVb (Buchmann 94)

E2 ground state cross section:

- resonant capture through  $2^+$  states
- direct capture ( $d \rightarrow s$ )
- $\sigma$  at 300 keV dominated by the high-energy tail of 6.92-MeV state
- $\alpha$ -reduced width uncertain
- $S_{E2}(300)=53\pm 18$  keVb (Tischhauser 02)

# cascade transitions

## Cascade cross section:

- 15-20% of total  $\sigma$
- 6.05, 6.92, 7.12-MeV levels
- direct process
- $S_{6.9}(300) \sim 7 \text{ keVb}$
- $S_{7.1}(300) \sim 1\text{-}2 \text{ keVb}$
- $S_{\text{casc}}(300) \sim 15 \text{ keVb}$

# $^{12}\text{C}(\alpha, \gamma)^{16}\text{O}$ at DRAGON

# 6.05 cascade at DRAGON

- 30-50 pA of  $^{12}\text{C}$  beam
- $P_{\text{He}} = 4$  and 8 Torr
- $2.25 < E < 5.5 \text{ MeV}$
- $l_{\text{target}} = 12.1\text{-}12.3 \text{ cm}$
- 8, 10 mm exit apertures

# 6.05 cascade at DRAGON

# Dragon acceptance

- magnetic steerers
- mistuning tests
- lateral, angular displacement
- 1<sup>st</sup> run: 70-90% acceptance
- 2<sup>nd</sup> run: 90-95% acceptance

# r-matrix

$$S_{6.0}^{+}(300)=29\pm 12 \text{ keVb}$$

$$S_{6.0}^{-}(300)=20\pm 10 \text{ keVb}$$

---

$$S_{6.0}(300)=25\pm 16 \text{ keVb}$$

C. Matei, L. Buchmann, et al. PRL 97, 242503 (2006)

# transitions revisited

- $S_{E1}(300) = 79 \pm 21$  keVb (Buchmann 94)
- $S_{E2}(300) = 53 \pm 18$  keVb (Tischhauser 02)

Cascade cross section:

- $S_{6.05}(300) \sim 25$  keVb
- $S_{6.9}(300) \sim 7$  keVb
- $S_{7.1}(300) \sim 1-2$  keVb
- $S_{\text{casc}}(300) \sim 35 \pm 20$  keVb

# 6.92 branching at Ohio U

- $\alpha$ -particle width of the 6.92-MeV state uncertain
- $7.12 \rightarrow 6.92$  branching unknown
- finite branching  $\Rightarrow \Theta_{\alpha}^{6.9}$  uncertain
- finite branching  $\Rightarrow S_{6.9}$  extrapolation error

# the experiment

# branching ratios

$$f = \frac{N_{1\text{MeV}} / \epsilon_{\text{HPGe}}}{0.7 N_{\text{NaI}} / \epsilon_{\text{NaI}}} = (8.3 \pm 0.4) \times 10^{-4}$$

# r-matrix formalism

- summation over all incoming angular momenta  $l_i=0,1,2,3,4$

$$\sigma_E = \frac{\pi}{k_\alpha^2} \sum_{l_i} (2l_i + 1) |U_{l_i}|^2,$$

with

$$U_{l_i} = -ie^{i(\omega_{l_i} - \phi_{l_i})} 2P_{l_i}^{1/2} k_\gamma^{L+1/2} \\ \times \frac{R_{l_i\gamma} + R_{l_i\gamma}^{ext}}{1 - (S_{l_i} - B_{l_i} + iP_{l_i})R_{l_i}},$$

$$R_{l_i} = \sum_{\lambda} \frac{\gamma_{\lambda l_i}^2}{E_{\lambda l_i} - E},$$

$$R_{l_i\gamma} = \sum_{\lambda} \frac{\gamma_{\lambda l_i} \gamma_{\lambda l_i \gamma}}{E_{\lambda l_i} - E}$$

# r-matrix formalism

- parametrization equivalent to Barker & Kajino 1991

$$R_{l_i\gamma}^{ext} = \frac{C_{l_f} W_{l_f}(a)}{k_\alpha} \left( \frac{\alpha \mu c}{15 \hbar} \right)^{1/2} i^{l_i+2-l_f} (l_i 200 | l_f 0) \\ \times \left( \frac{a}{\hbar c} \right)^{5/2} \mu^2 \left( \frac{Z_1}{M_1^2} + \frac{Z_2}{M_2^2} \right) \\ \times \{ [1 - (S_{l_i} - B_{l_i}) R_{l_i}] F_{l_i} G_{l_i} J'_{l_i l_f} + k_\alpha a R_{l_i} J''_{l_i l_f} \},$$

$$C_{l_f} = \sqrt{\frac{2\mu a}{\hbar^2 W_{l_f}^2(a)}} \left( \frac{\gamma_{l_f}}{\sqrt{1 + \gamma_{l_f}^2 \frac{dS_{l_f}}{dE}}} \right)$$

# r-matrix fit

# branching influence

# summary

- ◆ upper limit on the 7.12  $\rightarrow$  6.92 branching ratio
- ◆ R-Matrix fits give:
  - ◆  $\gamma_{6.9} = 0.74 \pm 0.12 \text{ MeV}^{1/2}$
  - ◆  $S_{6.9}(300) = 7.1 \pm 1.6 \text{ keV b}$
- ◆ calculate influence on the E2 ground state extrapolation

- ◆ measured capture cross section through 6.05-MeV level
  - ◆  $S_{6.0}(300) = 25 \pm 16 \text{ keVb}$
- ◆ analyze cascade through 6.92-MeV state
