Why another ^{16}N decay experiment?

Previous Measurements

			S(E1) [keVb]
■ Mainz (1969-1974)	Si	35 μ	-
■ TRIUMF (1993-1997)	Si	11-16 μ	57- 82
■ Yale (1993-1997)	Si	50 μ	95
■ Seattle (1994-1995)	Si	? μ	-

- All experiments use Si detectors
- Still a large variation in S(E1)

Systematic Uncertainties (PRC 50, 1194(94))

TRIUMF: $S_{E_1}(300)=79 \pm 16$ (stat) ± 14(sys) keVb	
Energy calibration	± 10 keVb
β -branching ratio (1^-)	± 6 keVb
^{17}N subtraction	± 5 keVb
Systematic differences between data sets	± 4 keVb
Coincidence efficiency	± 3 keVb
Uncertainty in Γ_γ (7.12 MeV)	± 3 keVb
Uncertainty in energy resolution	± 2 keVb
Normalization of $^{12}\text{C}(\alpha,\gamma)^{16}\text{O}$	± 2 keVb
^{18}N subtraction	± 1 keVb
Noise events	± 1 keVb

Goals of new experiment:

- **Setup with different detectors (different systematic uncertainties)**
- **Minimize sensitivity to the strong β -background**
- **Eliminate contributions from $^{17,18}\text{N}$ beams**
- **Improve energy calibration**
- **Better value for the branching ratio of the 7.116 MeV 1^- state**

Outline

- Twin-ionization chamber
- ^{16}N beam production technique
- Branching ratio experiment at Gammasphere
- Results

Advantages of gas over solid-state detectors

- Choose the thickness exactly as needed.
- This limits β sensitivity to a minimum.
- No radiation damage
- Available with large areas
- Improved homogeneity
- No dead layer
- Smaller pulse height defects
- Provides signal of emission angle (back-to back)

The twin ionization chambers

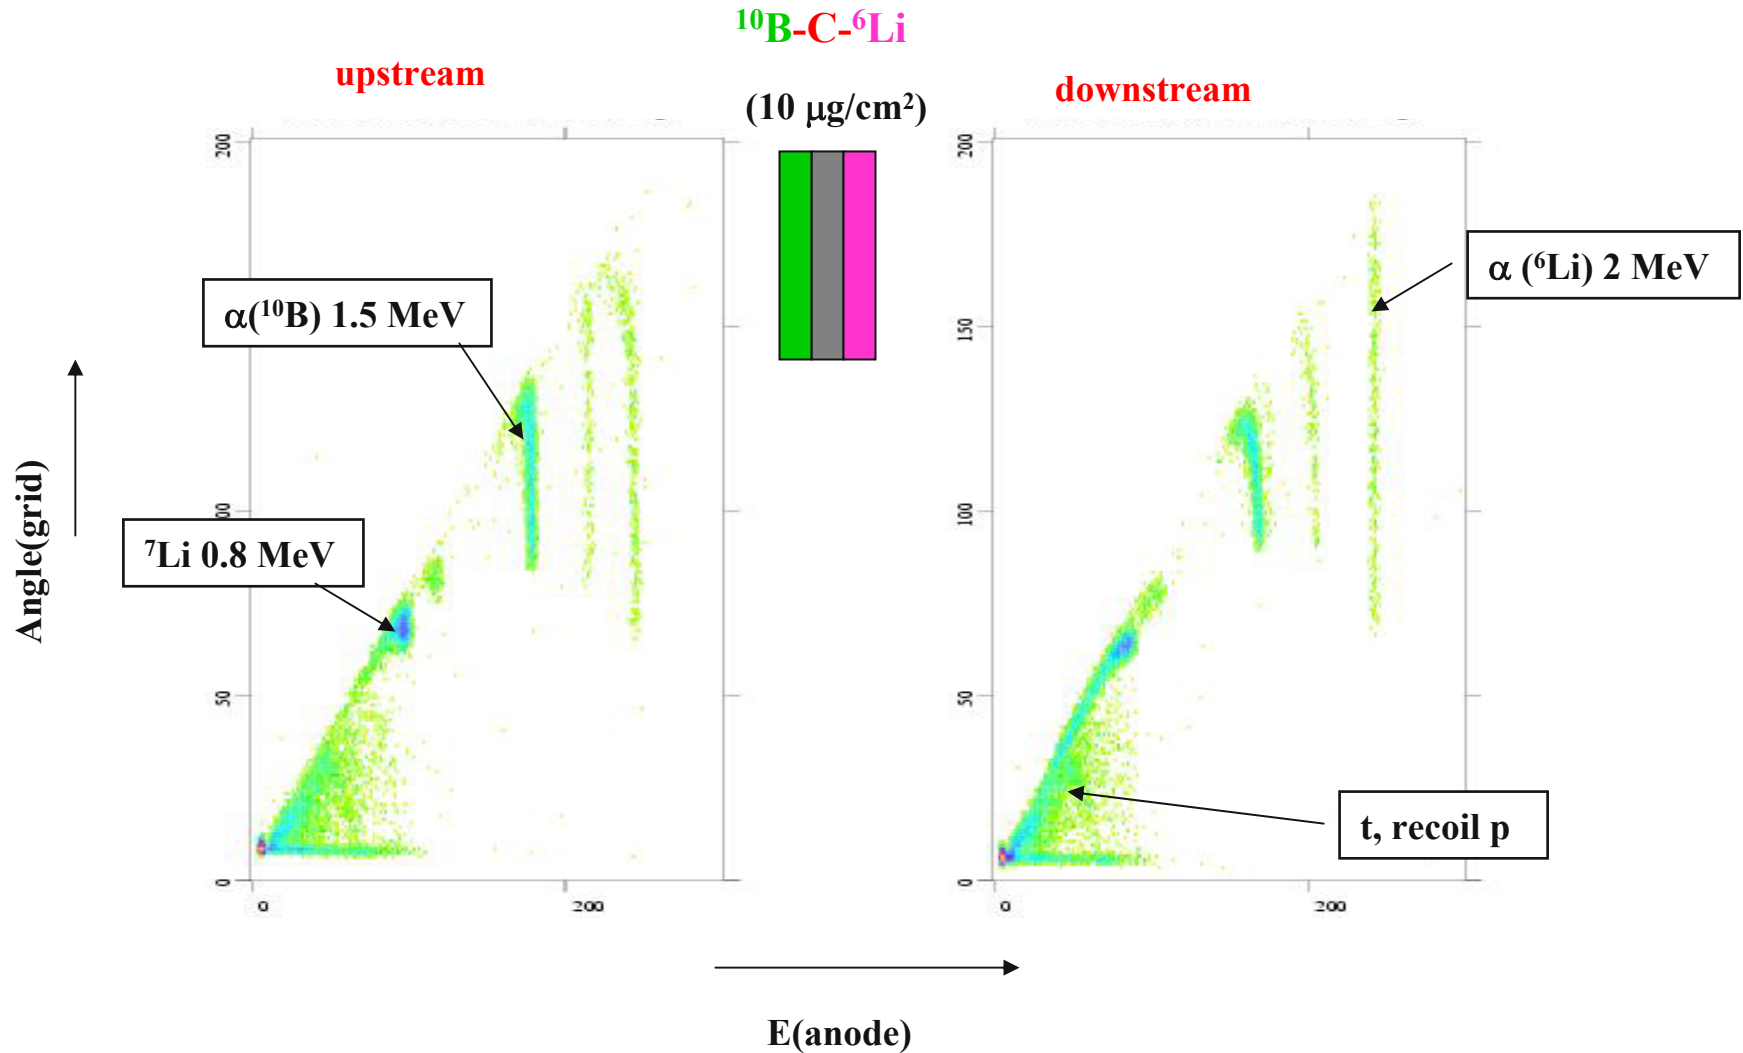

(NIMA 258, 209(1987))

Emission angle dependence of the Frisch grid signal

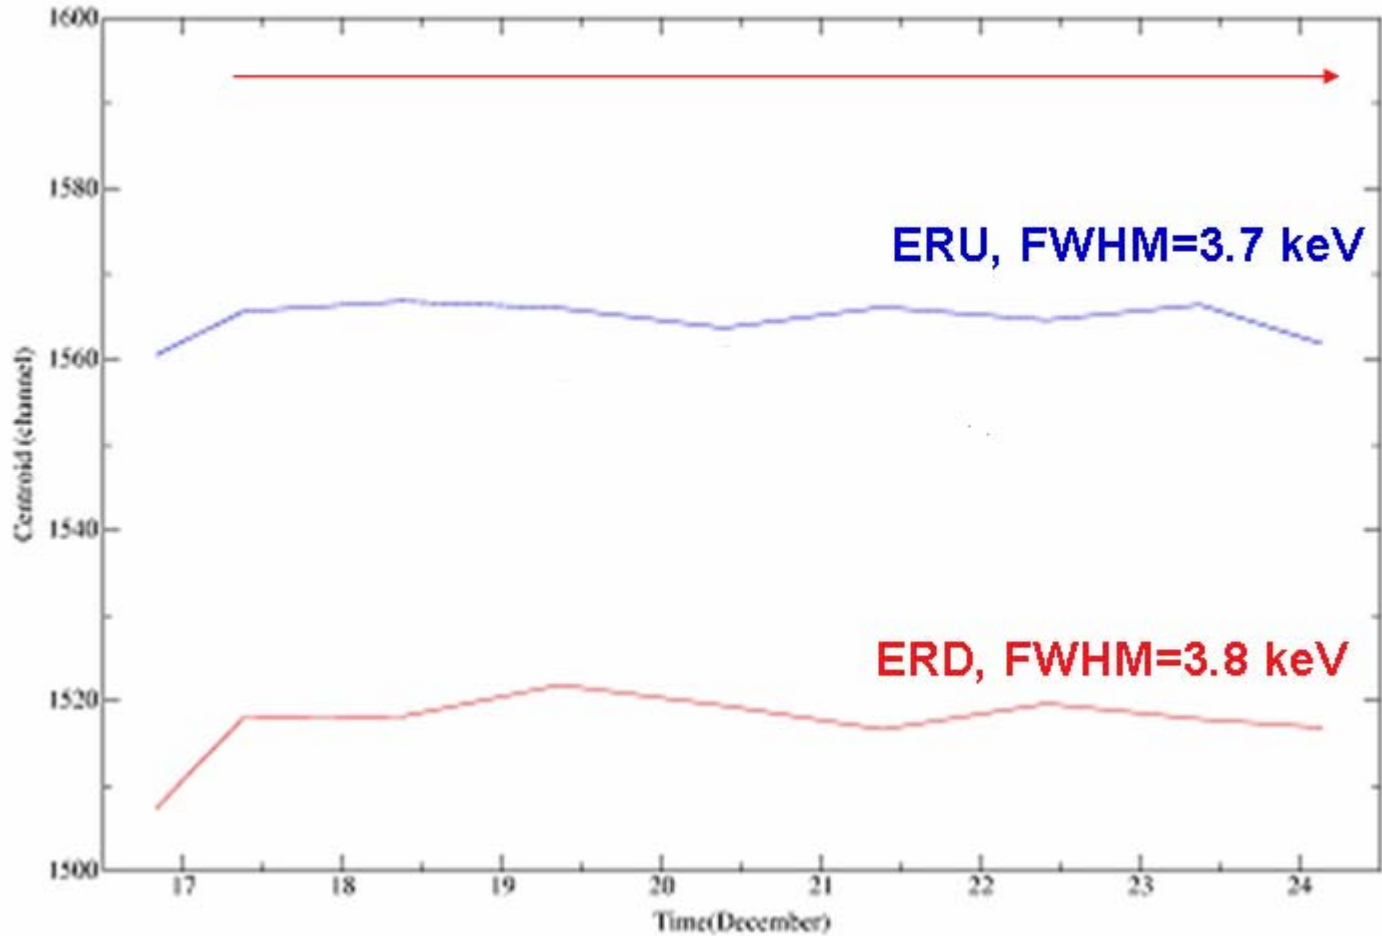

Energy calibration with a mixed ^{10}B - ^6Li source ($^{10}\text{B}(n,\alpha)^7\text{Li}$, $^6\text{Li}(n,\alpha)t$)

Summary

New experiment for the $^{12}\text{C}(\alpha,\gamma)^{16}\text{O}$ reaction

- Very clean ^{16}N beam
- High efficiency detectors
- No sensitivity to β 's
- Reduced systematic uncertainties

• $S(\text{E1})_{\text{prel}} = 72 \pm 13_{(\text{stat})} \pm 8_{(\text{systematic})} \text{ keVb}$

Background in double β decay

We have discovered a broad peak at 5.2 MeV with its leading edge at 5.3 MeV followed by a significant continuum. A similar peak has been observed in the UCSB-LBL detector³¹ at 5.1 MeV and has been attributed to a Doppler broadened line produced by the reaction $^{28}\text{Si}(n,n\gamma)^{28}\text{Si}$. We have been successful in reproducing our line at 5.2 MeV in a simple laboratory experiment. When soft solder is melted, the ^{210}Po , from the sequential decays of ^{210}Pb and ^{210}Bi , concentrates on the surface of the bead. After melting and solidifying several beads of solder, α spectra from their surfaces observed with a surface barrier detector were also found to contain this peak. The same phenomenon was observed in the UCI (University of California, Irvine) time projection chamber, and

Improvement in Systematic Uncertainties:

		improvement
Energy calibration	± 10 keVb	$\sim 1/4$
β -branching ratio	± 6 keVb	$\sim 1/4$
^{17}N subtraction	± 5 keVb	-
Systematic differences	± 4 keVb	
Coincidence efficiency	± 3 keVb	
Uncertainty in Γ_γ (7.12 MeV)	± 3 keVb	
Uncertainty in energy resolution	± 2 keVb	
Normalization of $^{12}\text{C}(\alpha,\gamma)^{16}\text{O}$	± 2 keVb	
^{18}N subtraction	± 1 keVb	
Noise events	± 1 keVb	

Background in double β decay

We have discovered a broad peak at 5.2 MeV with its leading edge at 5.3 MeV followed by a significant continuum. A similar peak has been observed in the UCSB-LBL detector³¹ at 5.1 MeV and has been attributed to a Doppler broadened line produced by the reaction $^{28}\text{Si}(n,n\gamma)^{28}\text{Si}$. We have been successful in reproducing our line at 5.2 MeV in a simple laboratory experiment. When soft solder is melted, the ^{210}Po , from the sequential decays of ^{210}Pb and ^{210}Bi , concentrates on the surface of the bead. After melting and solidifying several beads of solder, α spectra from their surfaces observed with a surface barrier detector were also found to contain this peak. The same phenomenon was observed in the UCI (University of California, Irvine) time projection chamber, and
